(54) Title: **MULTIPLE-DOSE BOTTLE WITH DOSAGE NOZZLE FOR LIQUIDS, PARTICULARLY FOR PHARMACEUTICAL PRODUCTS**

(57) Abstract: A multiple-dose bottle with dosage nozzle for liquids, particularly for pharmaceutical products, is deformable and has a nozzle (2) which comprises a valve (3) made of flexible material which can be coupled to the mouth (4) of the bottle (1) and has a plurality of passages (5) for the flow of the liquid and a cap (6) made of substantially rigid material which is fitted hermetically on the valve (3) and is provided, in an upward region, with a dispensing opening (7), compression of the bottle (1) producing the compression of the valve (3), the flow of the liquid between the valve (3) and the cap (6), and the release of the liquid through the dispensing opening (7).

MULTIPLE-DOSE BOTTLE WITH DOSAGE NOZZLE FOR LIQUIDS, PARTICULARLY FOR PHARMACEUTICAL PRODUCTS

TECHNICAL FIELD

The present invention relates to a multiple-dose bottle with dosage
5 nozzle for liquids, particularly for pharmaceutical products.

BACKGROUND ART

It is known that some products, such as for example medicines and
pharmaceutical products, if contained in multiple-dose bottles, use
preservatives in order to avoid possible bacterial contaminations due to
10 direct contact of the contained product with the surrounding air.

Applicable statutory provisions prescribe for the near future the
elimination of these preservatives from multiple-dose bottles, and this
disadvantageously makes that conventional types of said bottles which do
not ensure complete asepsis of the product are inadequate.

15 As an alternative, in order to obviate this drawback of conventional
multiple-dose bottles, single-dose bottles, meant to be used only once and
therefore requiring no preservatives, are used for the dosage of these
products.

However, even these single-dose bottles are not devoid of drawbacks,
20 including the fact that for an equal contained volume they require larger
dimensions and higher production costs than multiple-dose bottles.

Furthermore, asepsis of the product is ensured by wasting material due to
the fact that single-dose bottles are discarded after a single application of
the product.

25 DISCLOSURE OF THE INVENTION

The aim of the present invention is to eliminate the above-noted
drawbacks of conventional types of bottle by providing a multiple-dose
bottle with dosage nozzle for liquids, particularly for pharmaceutical
products, which allows to fully eliminate the use of preservatives which are
30 harmful to human health, to contain an aseptic product which can be used

even more than once and to reduce the waste of material and therefore the production and packaging costs of bottles for an equal volume of contained product.

Within the scope of this aim, an object of the present invention is to achieve the above-cited aim with a structure which is simple, relatively easy to provide in practice, safe in use, effective in operation, and relatively low in cost.

This and other objects are achieved by the present multiple-dose bottle with dosage nozzle for liquids, particularly for pharmaceutical products, characterized in that said bottle is deformable and that said nozzle comprises a valve made of flexible material which can be coupled to the mouth of the bottle and has a plurality of passages for the flow of the liquid and a cap made of substantially rigid material which is fitted hermetically on said valve and is provided, in an upward region, with a dispensing opening, compression of the bottle producing the compression of the valve, the flow of the liquid between the valve and the cap, and the release of said liquid through said dispensing opening.

BRIEF DESCRIPTION OF THE DRAWINGS

Further characteristics and advantages of the present invention will become better apparent from the following detailed description of a preferred but not exclusive embodiment of a multiple-dose bottle with dosage nozzle for liquids, particularly for pharmaceutical products, illustrated only by way of non-limitative example in the accompanying drawings, wherein:

Figure 1 is a sectional front view of a multiple-dose bottle with dosage nozzle for liquids, particularly for pharmaceutical products, according to the invention;

Figure 2 is a top view of the valve of the bottle according to the invention;

Figure 3 is a sectional view of the valve of the bottle according to the

invention;

Figure 4 is a top view of the cap of the bottle according to the invention;

Figure 5 is a sectional view of the cap of the bottle according to the invention;

5 Figure 6 is a top view of the gasket of the bottle according to the invention;

Figure 7 is a sectional view of the gasket of the bottle according to the invention;

10 Figure 8 is a bottom view of the gasket of the bottle according to the invention;

Figure 9 is a sectional view of the nozzle of the bottle according to the invention when not in use;

Figure 10 is a sectional view of the nozzle of the bottle according to the invention in the dispensing configuration.

15 WAYS OF CARRYING OUT THE INVENTION

With reference to the above figures, 1 generally designated a multiple-dose bottle with dosage nozzle for liquid products.

20 The bottle 1 is made of highly deformable material and is provided with a nozzle 2 which comprises a valve 3 made of flexible material which can be coupled to the mouth 4 of the bottle 1 and has a plurality of passages 5 for the flow of the liquid.

A cap 6, made of substantially rigid material, is fixed at its lower part to the mouth 4, is fitted hermetically on the valve 3 and has, in an upward region, a dispensing opening 7.

25 Compression of the bottle 1 produces the compression of the upper portion of the valve 3, the separation of the cap 6 from the internal wall and the flow of the liquid between said valve and the cap 6, with subsequent release through the dispensing opening 7.

30 The cap 6 furthermore has a plurality of symmetrically arranged longitudinal grooves 8 for the flow of the liquid, an annular groove 9, and a

plurality of radial notches 10 for connection between the annular groove 9 and the longitudinal grooves 8.

The dispensing opening 7 is formed at an external protrusion 11 which is substantially nipple-shaped.

5 Near the protrusion 11, the valve 3 is provided with a pin 12 for closing the opening 7 and is thinner so as to facilitate the compression of the liquid being released and its consequent flow between the cap and the valve.

A sealing gasket 13 is arranged between the mouth 4 of the bottle 1 and the valve 3 and has a plurality of holes 14 for the flow of the liquid, an
10 upper annular raised portion 15 for coupling to the valve 3, and a lower annular raised portion 16 for coupling to the mouth of the bottle 4.

The upper raised portion 15 allows to keep the internal chamber of the valve 3 at a pressure which makes the upper part of the valve adhere perfectly to the rigid cap 6.

15 The valve 3 is provided, in a downward region, with an annular raised portion 17 which is adapted to form an annular channel 18 for collecting the liquid between the passages 5 and the holes 14 of the gasket 13: in this way the holes and the liquid flow passages need not be matched up.

A ring 19 is rigidly coupled to the mouth 4 of the bottle 1, is connected
20 through conventional sealing means to a dome-shaped cover 20 for closing the cap 6, and can be eliminated once the sealing means have been removed.

It is possible to fix above the cover 20 a safety top 21 of the child-proof type; however, embodiments of the invention which do not have the cover 20 and/or the safety top 21 must not be excluded.

25 It is also possible to have the cap 6 or the mouth 4 extend downwards with a partial enclosure, not shown, which is adapted to support the bottle in a vertical position.

The bottle 1, the cap 6, the valve 3 and the gasket 13 are made of a material such as plastic and/or rubber, are sterilizable, inert and
30 impermeable to liquids.

In addition to the pear-shaped type, as shown in Figure 1, it is possible to provide several alternative embodiments of the bottle, including the vertical and horizontal cylindrical or accordion types.

The operation of the invention is as follows:

5 By compressing the deformable bottle, the liquid that flows out of the mouth 4 passes through the plurality of holes 14 of the gasket 13, reaches the annular channel 18, flows from there into the annular groove 9 of the cap 6, through the passages 5, and finally reaches the longitudinal grooves 8 through the notches 10, where it compresses the upper thinner portion of the
10 valve 3 which adheres to the respective internal part of the cap 6.

This compression overcomes the force applied by the air contained in the valve 3 and produces a lowering and consequent separation of the upper portion of the valve 3 from the cap 6 and of the pin 12 from the dispensing opening 7, thus allowing liquid to flow between the valve and the cap and to
15 subsequently be released through this opening.

When the bottle is released, the upper part of the valve 3 is no longer subjected to any force and returns to the initial sealing position under the action of the air contained internally; the pin 12 likewise returns to close the opening 7.

20 At the same time, the liquid being released that is still present at the opening 7 and is therefore in contact with the surrounding outside environment is expelled, thus eliminating any reverse flow of liquid and entry of contaminants.

At rest, the valve 3 adheres perfectly to the cap 6 and prevents all
25 possible external contamination as well as any release of liquid contained in the bottle 1.

The invention thus conceived is susceptible of numerous modifications and variations, all of which are within the scope of the inventive concept.

All the details may further be replaced with other technically equivalent
30 ones.

In practice, the materials employed, as well as the shapes and the dimensions, may be any according to requirements without thereby abandoning the scope of the protection of the appended claims.

The disclosures in Italian Patent Application No. MO99A000140 from
s which this application claims priority are incorporated herein by reference.

CLAIMS

1. A multiple-dose bottle with dosage nozzle for liquids, particularly for pharmaceutical products, characterized in that said bottle (1) is deformable and that said nozzle (2) comprises a valve (3) made of flexible material
5 couplable to the mouth (4) of the bottle (1) and has a plurality of passages (5) for the flow of the liquid and a cap (6) made of substantially rigid material which is fitted hermetically on said valve (3) and is provided, in an upward region, with a dispensing opening (7), compression of the bottle (1) producing the compression of the valve (3), the flow of the liquid between
10 the valve (3) and the cap (6), and the release of said liquid through said dispensing opening (7).

2. The bottle according to claim 1, characterized in that it comprises a sealing gasket (13) which is interposed between said mouth (4) and said valve (3) and has a plurality of holes (14) for the passage of the liquid.

15 3. The bottle according to one or more of the preceding claims, characterized in that said gasket (13) comprises a lower annular raised portion (16) for coupling to the mouth (4) of the bottle (1) and an upper annular raised portion (15) for hermetic coupling to the lower portion of the valve (3).

20 4. The bottle according to one or more of the preceding claims, characterized in that said cap (6) can be fixed at its lower part to said mouth (4) and comprises, along the internal surface, a plurality of longitudinal grooves (8) for the passage of the liquid.

25 5. The bottle according to one or more of the preceding claims, characterized in that said cap (6) comprises, in a downward region, an internal annular groove (9) for the passage of the liquid and a plurality of notches (10) for connection between said longitudinal grooves (8) and said annular groove (9).

30 6. The bottle according to one or more of the preceding claims, characterized in that the opening (7) of said cap (6) is substantially axial and

is formed at an external protrusion (11) which is substantially nipple-shaped.

7. The bottle according to one or more of the preceding claims, characterized in that said valve (3) has, in a downward region, an annular raised portion (17) which is adapted to create an annular channel (18) for
5 collecting the liquid between the passages (5) of said valve (3) and the holes (14) of said gasket (13).

8. The bottle according to one or more of the preceding claims, characterized in that said valve (3) has, in an upward region, a pin (12) for
10 closing said opening (7).

9. The bottle according to one or more of the preceding claims, characterized in that said valve (3) is made of a material such as rubber which is sterilizable, inert and impermeable to liquids.

10. The bottle according to one or more of the preceding claims,
15 characterized in that said cap (6) and said gasket (13) are made of a material such as plastic which is sterilizable, inert and impermeable to liquids.

11. The bottle according to one or more of the claims 1-9, characterized in that said cap (6) and said gasket (13) are made of a material such as rubber which is sterilizable, inert and impermeable to liquids.

20 12. The bottle according to one or more of the preceding claims, characterized in that said valve (3) is thinner at its end region to allow the flow of liquid and is thicker in a downward region in order to hermetically close against the surface of the gasket (13).

13. The bottle according to one or more of the preceding claims,
25 characterized in that a ring (19) is coupled at said mouth (4) and is connected by way of removable sealing means to a dome-shaped cover (20) for closing said cap (6).

14. The bottle according to one or more of the preceding claims, characterized in that a safety top (21) is fittable on said cover (20).

30 15. The bottle according to one or more of the preceding claims,

characterized in that said cap (6) continues downwards with a partial enclosure for supporting the bottle (1) in a vertical position.

16. The bottle according to one or more of the preceding claims,
characterized in that said mouth (4) continues downwards and outwards
5 with a partial enclosure for supporting the bottle (1) in a vertical position.
